

## **Archiving Old Tables in Database Project**

The goal of this project is to write an Ansible script that checks for the archived RDS MySQL tables, backs them up to an AWS S3 bucket, and sends an alert via AWS SNS service (which in turn sends email) once done. The system should also send an alert via AWS SNS service if the script fails at any point during the process. The details are described below:

- Write an Ansible script to check for archived RDS MySQL tables (the tables are prefixed with ARCHIVE\_)
- Back them up into an AWS S3 bucket.
- Delete the archived tables once done.
- Send an alert once the process is complete. Also send an alert if any errors are encountered.
- Make sure your code is readable and can be run.
- Check in your code to bitbucket and write instructions on readme on how to run.

Share with us the bitbucket and we will review your project from there.
